

DEER FREE WINTER ARMOR

Deer protection

Product Features

A hungry deer will find almost any plant palatable, so no plant is “deer proof.” Also, a plant species may be damaged rarely in one area but damaged severely in another.

Repellents: The two types of deer repellents are contact repellents and area repellents. Contact repellents are applied directly to plants, causing them to taste bad or remove the taste of the plant that the deer are looking for.
