Specification Sheet

Lodgepole Pine Tree Stakes

Lodgepole Pine come from various regions of North America and grows in dense pure stands making it readily available and inexpensive as a tree support. They also have a very straight and gradually tapering trunk that contributes to its desirability as a tree support.

The pine poles are peeled, removing all bark, to a smooth diameter. They are then pointed on one end, chamfered at the other and pressure treated with an EPA registered pesticide to protect them from insect attack and decay.

The resulting product is an inexpensive durable and strong support for trees. Once the stakes are treated they are shipped from Oakdale, CA or Riverbank, CA.

The dimensions are as follows:

2" X 6', 8', 10', and 12'

2 ½" X 10', and 12'

3" X 8', 10', 12', 14', and 16'

The treatment of round wood products is through pressure treating using ACQ (alkaline copper quaternary) or Chemonite/ACZA (Ammoniacal Copper Zinc Arsenate). The preservative chemicals and treatment procedures are provided by Chemical Specialties, Inc. Charlotte, North Carolina
